POSTER 6 | SURFACE SELECTION

CHOOSE THE RIGHT APPROACH

THE MATERIAL DETERMINES THE CLEANUP

Inspect first. Check compatibility. Remove contamination.

Illustrative materials

01 HARD, WASHABLE SURFACES

Glass, glazed tiles and other non-absorbent surfaces may be suitable for cleaning and treatment. Confirm chemical compatibility and test a small area. Coatings, metals, stone and joints need particular care.

02 POROUS & ABSORBENT MATERIALS

Plasterboard, insulation, carpet, ceiling tiles and wallpaper can contain mould below the surface. Surface spraying may not reach embedded growth. Affected materials may need professional removal and replacement.

03 SPECIALIST SITUATIONS

Extensive or hidden growth, contaminated ventilation systems and sewage-related water damage need an appropriate remediation plan. Valuable or delicate materials should be assessed by a suitable specialist.

PROTECT PEOPLE DURING THE WORK

Keep uninvolved occupants away from cleanup. People with weakened immunity should avoid mouldy areas and remediation work. Select protection for both mould exposure and the treatment chemical. Follow the safety data sheet.

COMPLETE THE CLEANUP

Remove fungal material and treatment residues. Dry the surface fully. Fix the moisture problem before painting or sealing. Discolouration may remain after cleaning; appearance alone cannot verify complete removal.

CHECK THE RESULT

Confirm that the moisture source is corrected and the area is dry. Reinspect for visible growth and mouldy odours. Document what was treated, what was removed and when follow-up is due.

ViroIOxy® | MANUFACTURER–SUPPLIED SURFACE PROTOCOL

5% SOLUTION
Apply to a compatible washable surface as permitted by the label.

30 MINUTES
Maintain wet contact throughout the specified period.

RINSE & DRY
Rinse with clean water, remove residues and dry thoroughly.

Use suitable gloves and eye protection. Ventilate and avoid inhaling spray. Do not mix cleaning products. Follow the current product label and safety data sheet.
