Balanced parallel flow • Correctly sized manifolds
Adequate feed pressure • Coordinated backwash cycles

BUILD YOUR CAPACITY WITH WATCH WATER.
Ask your Watch Water partner about a parallel UF configuration.

*Nominal arithmetic totals at 2,200 L/h per unit, based on published UF data at 25°C and 4 bar.
Actual net output depends on feed water, available pressure, hydraulic design and backwash downtime.
Concept visualization. Proposed 25-unit configuration requires application-specific engineering and validation.
